# Week 4: User Profiles and Content Based RSs - Cont.

CS3448: Recommender Systems / CSX4207/ITX4207: Decision Support and Recommender Systems

Asst. Prof. Dr. Rachsuda Setthawong

## Objectives

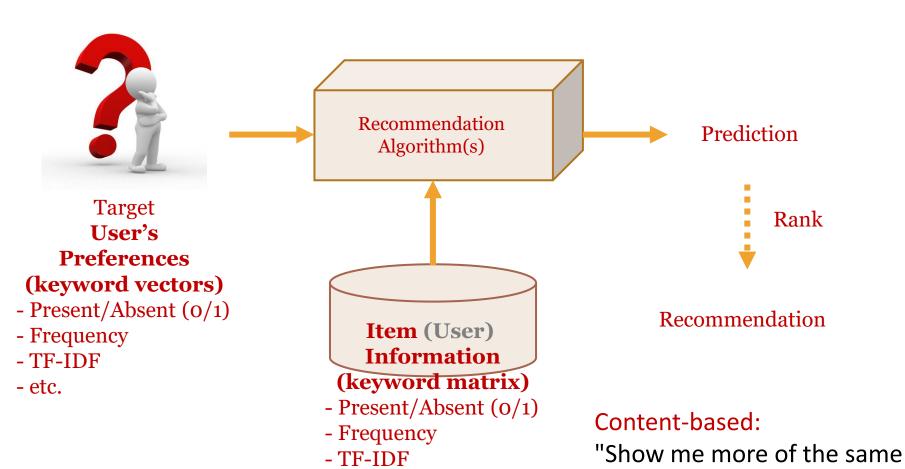

- To understand text classification methods
- To be familiar with additional algorithms in this approach
- To understand evaluation measures and to be able to apply them
- To understand the limitations of content-based approach
- To understand the scope of mini project 1 and to be able to develop simple content based recommendation algorithms

## **Outlines**

- Recommendation as Text Classification Problems
  - Naïve Bayes
  - Additional Probabilistic Methods
- Additional Algorithm
- Limitations of Content-based Recommendation Methods
- Evaluation Measures

what I've liked"

# How to Generate Recommendation Using Content Based Approach

- etc.

## Recommendation as Text Classification Problem

- Probabilistic-based approach:
  - Given Boolean representation with 2 classes:
    - *like* (class label = 1)
    - *dislike* (class label = 0)
  - For each unseen document, calculate probability of *like* and *dislike* using Bayes theorem

$$P(Y|X) = \frac{\prod_{i=1}^{d} P(X_i|Y) \times P(Y)}{P(X)}$$

- where Y is is class label, X is the set of attributes of the document, and d is no. of attributes. (Note: The calculation of P(X) can be omitted.)
- ACTION: An unseen document should be recommended to the user if
   P(Label=1|X) > P(Label=0|X).

## Bayes Classifier

(A Simplified Model of Bayes Theorem)

• The function that assigns a class label  $\hat{y} = C_k$  using the following formula:

$$\hat{y} = \underset{k \in \{1, \ldots, K\}}{\operatorname{argmax}} p(C_k) \prod_{i=1}^{r} p(x_i \mid C_k).$$
where,
$$p(C_k) \text{ is prior probability (class probability)}$$

$$p(x=v \mid C_k) \text{ is posterior probability}$$

$$\text{(the probability distribution of } v \text{ given a class } C_k)$$

## The target user's profile:

Doc-ID	python	amazon	forest	program	Label
1	1	1	1	0	1
2	0	0	1	1	0
3	1	1	0	0	1
4	1	O	1	1	1
5	0	O	0	1	O

#### Unseen Document

Doc-ID	python	amazon	forest	program	Label
6	1	1	0	0	?

The target user's profile:

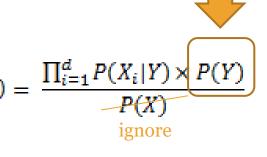

Doc-ID	python	amazon	forest	program	Label
1	1	1	1	0	1
2	0	0	1	1	O
3	1	1	0	0	1
4	1	O	1	1	1
5	0	0	0	1	0

### **Unseen Document**

Doc-ID	python	amazon	forest	program	Label
6	1	1	0	0	?

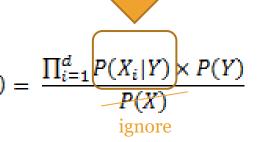

#### **Prior Probabilites:**

$$P(Label=1) = 3/5$$
  
 $P(Label=0) = 2/5$ 

## The target user's profile:

Doc-ID	python	amazon	forest	program	Label
1	1	1	1	0	1
2	0	0	1	1	0
3	1	1	0	0	1
4	1	O	1	1	1
5	0	0	O	1	0

### **Unseen Document**

Doc-ID	python	amazon	forest	program	Label
6	1	1	0	0	?

#### posterior probability:

$$P(python=1|Label=1) = 3/3$$
  
 $P(amazon=1|Label=1) = 2/3$   
 $P(forest=0|Label=1) = 1/3$   
 $P(program=0|Label=1) = 2/3$ 

$$P(python=1|Label=0) = 0/2$$
  
 $P(amazon=1|Label=0) = 0/2$   
 $P(forest=0|Label=0) = 1/2$   
 $P(program=0|Label=0) = 0/2$ 

The model built from the target user's profile:

#### **Prior Probabilites:**

```
P(Label=1) = 3/5
P(Label=0) = 2/5
```

#### posterior probability:

```
\begin{array}{ll} P(python=1|Label=1)=3/3 & P(python=1|Label=0)=0/2 \\ P(amazon=1|Label=1)=2/3 & P(amazon=1|Label=0)=0/2 \\ P(forest=0|Label=1)=1/3 & P(forest=0|Label=0)=1/2 \\ P(program=0|Label=1)=2/3 & P(program=0|Label=0)=0/2 \\ \end{array}
```

# $P(Y|X) = \frac{\prod_{i=1}^{d} P(X_i|Y) \times P(Y)}{P(X)}$

#### **Unseen Document**

Doc-ID	python	amazon	forest	program	Label	4
6	1	1	0	0	?	

$$P(Label=1|X) = [P(python=1|Label=1) \times P(amazon=1|Label=1) \times P(forest=0|Label=1) \times P(program=0|Label=1) \times P(Label=1)] / (P(X)$$

$$= [(3/3 \times 2/3 \times 1/3 \times 2/3) \times (3/5)]/P(X)$$

$$= (0.149 \times 3/5)/P(X) = 0.089/P(X)$$

The model built from the target user's profile:

#### **Prior Probabilites:**

```
P(Label=1) = 3/5
P(Label=0) = 2/5
```

#### posterior probability:

```
P(python=1|Label=1) = 3/3 \qquad P(python=1|Label=0) = 0/2 \\ P(amazon=1|Label=1) = 2/3 \qquad P(amazon=1|Label=0) = 0/2 \\ P(forest=0|Label=1) = 1/3 \qquad P(forest=0|Label=0) = 1/2 \\ P(program=0|Label=1) = 2/3 \qquad P(program=0|Label=0) = 0/2
```

#### **Unseen Document**

D(V V)	$\prod_{i=1}^{a} P(X_i Y) \times P(Y)$
P(Y X) =	P(X)

Doc-ID	python	amazon	forest	program	Label	
6	1	1	0	0	?	

$$P(Label=o|X) = [P(python=1|Label=o) \times P(amazon=1|Label=o) \times P(forest=o|Label=o) \times P(program=o|Label=o) \times P(Label=o)] / (P(X))$$

$$= [(O/2 \times O/2 \times 1/2 \times O/2) \times (2/5)]/P(X)$$

$$= O/P(X) = O$$

$$\hat{y} = egin{array}{c} rgmax \ k \in \{1, \ldots, K\} \end{array} p(C_k) \prod_{i=1}^n p(x_i \mid C_k).$$

- P(Label=1|X) > P(Label=0|X)
  - ... DocID 6 should be recommended to the user.

## Pros of Naïve Bayes

- Boolean representation is simple with the assumption of positional independence.
- The component of the classifier can be easily updated.
- The learning time complexity remains linear to the number of examples.

## Cons of Naïve Bayes

- It does not enforce conditional independence of events,
  - e.g., "San Fancisco", "United State of America"
- The **cold start problem** (**new user**'s problem) still exists.
  - Solution 1: let the user manually label a set of documents.
  - Solution 2: ask the user to provide a list of interest words for each topic category.

## Additional Probabilistic Methods

Alter the posterior probability of the the original Bayes theorem;

$$P(Y|X) = \frac{\prod_{i=1}^{d} P(X_i|Y) \times P(Y)}{P(X)}$$

• Estimate probability of term  $v_i$  occurring in a document of class C by relative frequency of  $v_i$  in all documents of the class.

$$P(v_i|C=c) = \frac{CountTerms(v_i, docs(c))}{AllTerms(docs(c))}$$

Laplace smoothing

$$\hat{P}(v_i|C=c) = \frac{CountTerms(v_i, docs(c)) + 1}{AllTerms(docs(c)) + |V|}$$

 $CountTerms(v_i, docs(c)) =$  **the number of appearances of term**  $v_i$  in documents labeled with c

AllTerms(docs(c)) = **the number of all terms** in the documents labeled with c

|V| = the number of distinct terms appearing in all documents (vocabulary)

# **Example 2:** should DocID 6 be recommended to the user whose profiles are given below?

The target user's profile:

	Words	Label
1	recommender intelligent recommender	1
2	recommender recommender learning	1
3	recommender school	1
4	teacher homework recommender	0

#### **Unseen Document**

DocID	Words	Label
6	recommender recommender teacher homework	;

# **Example 2:** should DocID 6 be recommended to the user whose profiles are given below? - *Cont*.

#### The target user's profile:

DocID	Words	Label
1	recommender intelligent recommender	1
2	recommender recommender learning	1
3	recommender school	1
4	teacher homework recommender	O

#### 6 distinct terms:

- recommender
- 2. intelligent
- 3. learning
- 4. school
- 5. teacher
- 6. homework

#### **Unseen Document**

DocID	Words	Label
6	recommender recommender teacher homework	?

```
P(recommender|Label = 1) = (5+1)/(8+6) = 6/14

P(homework|Label = 1) = (0+1)/(8+6) = 1/14

P(teacher|Label = 1) = (0+1)/(8+6) = 1/14

P(recommender|Label = 0) = (1+1)/(3+6) = 2/9

P(homework|Label = 0) = (1+1)/(3+6) = 2/9

P(teacher|Label = 0) = (1+1)/(3+6) = 2/9

P(Label=1) = 3/4

P(Label=0) = 1/4

P(Label=1|DocID<sub>6</sub>) = ?

P(Label=0|DocID<sub>6</sub>) = ?
```

$$\widehat{P}(v_i|C=c) = \frac{CountTerms(v_i, docs(c)) + 1}{AllTerms(docs(c)) + |V|}$$

$$P(Y|X) = \frac{\prod_{i=1}^{d} P(X_i|Y) \times P(Y)}{P(X)}$$

 $CountTerms(v_i, docs(c)) =$  **the number of appearances of term**  $v_i$  in documents labeled with c

AllTerms(docs(c)) = **the number of all terms** in the documents labeled with c

|V| = **the number of distinct terms** appearing in all documents (vocabulary)

```
Unseen Document
                                                           Label
DocID
        Words
                                                                     \hat{P}(v_i|C=c) = \frac{CountTerms(v_i, docs(c)) + 1}{AllTerms(docs(c)) + |V|}
        recommender recommender teacher homework
                     (The word 'recommender' presents 3 times in DocID 6.)
     P(\text{recommender}|\text{Label} = 1) = 3/7
                                                                            P(Y|X) = \frac{\prod_{i=1}^{d} P(X_i|Y) \times P(Y)}{P(X_i|Y)}
     \hat{P}(\text{homework}|\text{Label} = 1) = 1/14
     \hat{P}(\text{teacher}|\text{Label} = 1) = 1/14
     \hat{R}(\text{recommender}|\text{Label} = 0) = 2/9
     \hat{P}(\text{homework}|\text{Label} = 0) = 2/9
     \hat{P}(\text{teacher}|\text{Label} = 0)
                                    = 2/9
                                                                   P(Label=1) = 3/4 P(Label=0) = 1/4
     P(Label=1|v_1...v_n) = [(3/7)^{3}*1/14*1/14*3/4]/P(v_1...v_n) \approx 0.0003/P(v_1...v_n)
     P(Label=0|v_1...v_n) = [(2/9)^3 * 2/9 * 2/9 * 1/4] / P(v_1...v_n) \approx 0.0001 / P(v_1...v_n)
```

$$P(Label=1|v_1...v_n) > P(Label=0|v_1...v_n)$$

... DocID 6 should be recommended to the user.

## **Outlines**

- Recommendation as Text Classification Problems
  - Naïve Bayes
  - Additional Probabilistic Methods
- Additional Algorithm
- Limitations of Content-based Recommendation Methods
- Evaluation Measures

# Additional Algorithm

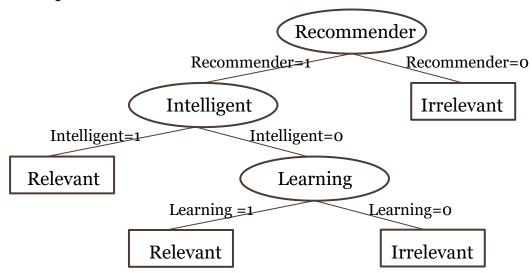

• Decision Tree

# Applying Decision Trees to the Recommendation Problem

Asst. Prof. Dr. Rachsuda Setthawong

- Basic idea:
  - Construct a tree whose inner nodes are keywords in documents (item features).
  - Tree's branches (edges) relates to *present* (= 0) or *absent* (= 1) of related keywords (inner nodes).
  - Leave nodes relates to recommendations (relevant/irrelevant).

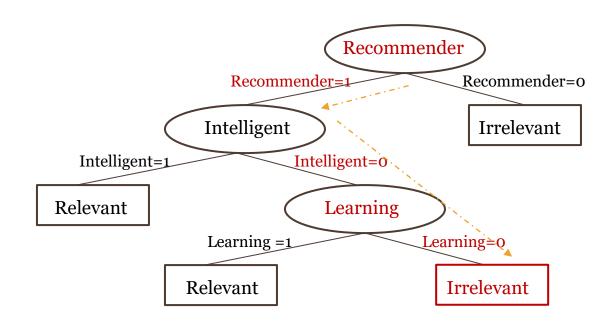

An Example of User Profile's Tree

## Generating a Recommendation:

## Traverse the User Profile's Tree Using an UnSeen Item

Unseen Document			
DocID	Words	Label

## Constructing A Decision Tree Using Hunt's Algorithm

 Let D<sub>t</sub> be the set of training records that reach a node t

### General Procedure:

- If D<sub>t</sub> is an empty set, then t is a leaf node labeled by the default class, y<sub>d</sub>
   Recursively apply the procedure to each subset.
- If D<sub>t</sub> contains records that belong the same class y<sub>t</sub>, then t is a leaf node labeled as y<sub>t</sub>
- If D<sub>t</sub> contains records that belong to more than one class, use an attribute test to split the data into smaller subsets.

Recursively apply the procedure to each subset.

Age	Gender	PlaySport	PassCourse?
16	Male	No	No
17	Female	No	Yes
20	Male	Yes	No
20	Male	No	No

Age	Gen der	Play- Sport	Pass- Course?
16	Male	No	No
20	Male	Yes	No
20	Male	No	No

Age	Gender	Play- Sport	Pass- Course?
17	Female	No	Yes

5	program computer programming	1

## Remark about A Decision Tree Constructing

- We didn't discuss about how to select the best split in this course.
- For further reading, see also
  - https://en.wikipedia.org/wiki/Decision\_tree\_learning

## Suggestions on Decision Tree Learners

- A decision tree model performs well when the number of features is relatively small.
- The model is more appropriate to apply on "meta" features
  - E.g., author name, and genre than on TF-IDF calculations.

## **Outlines**

- Recommendation as Text Classification Problems
  - Naïve Bayes
  - Additional Probabilistic Methods
- Additional Algorithm
- Limitations of Content-based Recommendation Methods
- Evaluation Measures

# Limitations of Content-based Recommendation Methods

- Limit judgement on quality/relevance of a document (item)
  - It cannot judge up-to-date-ness, utility, and beauty
- Content's size and extraction issue
  - Too short; feature vector's sparsity
  - Not be automatically extractable (e.g., multimedia).
- A need of ramp-up phase
  - Need some training data for its initialization.
- Overspecialization
  - Suggest "more of the same" items.

## **Outlines**

- Recommendation as Text Classification Problems
  - Naïve Bayes
  - Additional Probabilistic Methods
- Additional Algorithm
- Limitations of Content-based Recommendation Methods
- Evaluation Measures

## **Basic Evaluation Measures**

- Ground truth is given.
  - Accuracy
  - Precision
  - Recall
  - F-measure
- Otherwise,
  - Real users's evaluation (questionnaires, survey, etc.)

# Accuracy
